# The inverse problem of nonsymmetric matrices with a submatrix constraint and its approximation 

Yongxin Yuan, Hao Liu

#### Abstract

In this paper, we first give the representation of the general solution of the following least-squares problem (LSP): Given matrices $X \in \mathbf{R}^{n \times p}, B \in \mathbf{R}^{p \times p}$ and $A_{0} \in \mathbf{R}^{r \times r}$, find a matrix $A \in \mathbf{R}^{n \times n}$ such that $\left\|X^{T} A X-B\right\|=$ min, s. t. $A([1, r])=A_{0}$, where $A([1, r])$ is the $r \times r$ leading principal submatrix of the matrix $A$. We then consider a best approximation problem: given an $n \times n$ matrix $\tilde{A}$ with $\tilde{A}([1, r])=A_{0}$, find $\hat{A} \in \mathbf{S}_{\mathbf{E}}$ such that $\|\tilde{A}-\hat{A}\|=$ $\min _{A \in \mathbf{S}_{\mathbf{E}}}\|\tilde{A}-A\|$, where $\mathbf{S}_{\mathbf{E}}$ is the solution set of LSP. We show that the best approximation solution $\hat{A}$ is unique and derive an explicit formula for it.

Keywords-Inverse problem, Least-squares solution, model updating, Singular value decomposition(SVD), Optimal approximation.

## I. Introduction

THROUGHOUT this paper, we denote the real $m \times n$ matrix space by $\mathbf{R}^{m \times n}$, the set of all orthogonal matrices in $\mathbf{R}^{n \times n}$ by $\mathbf{O} \mathbf{R}^{n \times n}$, the transpose and the Moore-Penrose generalized inverse of a real matrix $A$ by $A^{T}$ and $A^{+}$, respectively. $I_{n}$ represents the identity matrix of order $n$. For $A=\left[a_{i j}\right], B=\left[b_{i j}\right] \in \mathbf{R}^{m \times n}, A * B$ represents the Hadamard product of the matrices $A$ and $B$, i.e., $A * B=\left[a_{i j} b_{i j}\right] \in$ $\mathbf{R}^{m \times n}$. For $A, B \in \mathbf{R}^{m \times n}$, an inner product in $\mathbf{R}^{m \times n}$ is defined by $(A, B)=\operatorname{trace}\left(B^{T} A\right)$, then $\mathbf{R}^{m \times n}$ is a Hilbert space. The matrix norm $\|\cdot\|$ induced by the inner product is the Frobenius norm.

Using the finite element technique, the dynamic analysis of a structure is modelled by the generalized eigenvalue problem [3]

$$
\begin{equation*}
K_{a} x=\lambda M_{a} x \tag{1}
\end{equation*}
$$

where $K_{a}, M_{a} \in \mathbf{R}^{n \times n}$ represent the analytical stiffness and mass matrices, respectively. High accuracy and large size structural applications require highly correlated finite element models to predict the system's dynamic behavior. Very often natural frequencies and mode shapes (eigenvalues and eigenvectors) of a finite element model described by (1) do not match very well with experimentally measured frequencies and mode shapes obtained from a real-life vibrating structure. Thus, a vibration engineer needs to update the theoretical finite

Yongxin Yuan: School of Mathematics and Physics, Jiangsu University of Science and Technology, Zhenjiang 212003, P. R. China. e-mail: yuanyx_703@163.com
Hao Liu: Department of Mathematics, Nanjing University of Aeronautics and Astronautics, Nanjing 210016, P. R. China. e-mail: hliu@nuaa.edu.cn
element model of the structure such that the updated model predicts the observed dynamic behavior. The improved model may then be considered to be a better dynamic representation of the structure than the initial analytical model. This model can be used with greater confidence for the analysis of the structure under different boundary conditions or with physical structural changes.

Let $X \in \mathbf{R}^{n \times p}$ be the measured modal matrix, $\Lambda \in \mathbf{R}^{p \times p}$ the measured natural frequencies, where $p<n$, and $\Lambda$ is diagonal. If the measured modal data $X$ and $\Lambda$ are correct, then the most common approach in finite element model updating is first to update the analytical mass or stiffness matrix to satisfy the basic orthogonality conditions

$$
X^{T} M X=I_{p}, \quad X^{T} K X=\Lambda
$$

where $M, K \in \mathbf{R}^{n \times n}$ are to be updated mass and stiffness matrices, respectively. Some methods have been developed to improve the quality of the analytical finite element models using measured modal data $[5,6,9,11,15,16,20]$. However, the updated mass and stiffness matrices are adjusted globally. A spatial representation of the structural-element property changes that resulted from the model errors is generally preferred for engineering applications. Model errors may be localized by using sensitivity analysis [17], least-squares approach [13] and assigned partial eigenstructure [8]. Based on the localization of model errors, it is practice to adjust partial elements of the analytical mass and stiffness matrices $M_{a}$ and $K_{a}$ using measured modal data. On the other hand, it is well known that mode shapes of a given structure that are determined experimentally by vibration tests are usually nonorthogonal due to equipment calibration, excessive noise, misinterpretation of data, etc. Thus, the problem of updating the mass or stiffness matrix which is known as an inverse problem in structural dynamics can be mathematically formulated as follows.

Problem I. Given matrices $X \in \mathbf{R}^{n \times p}, B \in \mathbf{R}^{p \times p}$ and $A_{0} \in \mathbf{R}^{r \times r}$, find a matrix $A \in \mathbf{R}^{n \times n}$ such that

$$
\left\|X^{T} A X-B\right\|=\min , \quad A([1, r])=A_{0}
$$

where $A([1, r])$ is the $r \times r$ leading principal submatrix of the matrix $A$.

Problem II. Let $\mathbf{S}_{\mathbf{E}}$ be the solution set of Problem I. Given a matrix $\tilde{A} \in \mathbf{R}^{n \times n}$ with $\tilde{A}([1, r])=A_{0}$, find $\hat{A} \in \mathbf{S}_{\mathbf{E}}$ such
that

$$
\begin{equation*}
\|\tilde{A}-\hat{A}\|=\min _{A \in \mathbf{S}_{\mathbf{E}}}\|\tilde{A}-A\| . \tag{2}
\end{equation*}
$$

There are many publications $[7,10,18]$ concerning inverse problems for matrices. The inverse problems for symmetric, bisymmetric and centrosymmetric matrices with a submatrix constraint have been considered in [19], [14] and [2], respectively. In the present paper, we will discuss Problem I and II.

The paper is organized as follows. In Section 2, we give an expression of the general solution of Problem I using the generalized inverses and the singular value decompositions (SVDs) of matrices. As a by-product of our results on Problem I, we obtain a necessary and sufficient condition on $X, B, A_{0}$ for existence of $A \in \mathbf{R}^{n \times n}$ such that $X^{T} A X=$ $B, A([1, r])=A_{0}$, and a general form for all such $A$. In Section 3, we show that there exists a unique solution to Problem II and present the expression of the solution $\hat{A}$ of Problem II. Finally, in Section 4, a numerical algorithm to acquire the best approximation solution under the Frobenius norm sense is described and a numerical example is provided. Clearly, the results obtained are shown to include those given in [12] as particular cases.

## II. The Solution of Problem I

To begin with, we introduce a lemma [4].
Lemma 1: If $E \in \mathbf{R}^{m \times l}, F \in \mathbf{R}^{q \times l}$ then the general solution of $\|Z E-F\|=\min$ is $Z=F E^{+}+L\left(I_{m}-E E^{+}\right)$, where $L \in \mathbf{R}^{q \times m}$ is an arbitrary matrix.

Let the partition of the matrix $X$ be

$$
X=\left[\begin{array}{l}
X_{1}  \tag{3}\\
X_{2}
\end{array}\right], \quad X_{1} \in \mathbf{R}^{r \times p}, \quad X_{2} \in \mathbf{R}^{(n-r) \times p} .
$$

Write

$$
A=\left[\begin{array}{cc}
A_{0} & F  \tag{4}\\
G & H
\end{array}\right],
$$

where $F \in \mathbf{R}^{r \times(n-r)}, G \in \mathbf{R}^{(n-r) \times r}$ and $H \in$ $\mathbf{R}^{(n-r) \times(n-r)}$ are yet to be determined. From (3) and (4), we have

$$
\begin{align*}
& \left\|X^{T} A X-B\right\|= \\
& \left\|X_{2}^{T} H X_{2}+X_{2}^{T} G X_{1}+X_{1}^{T} F X_{2}-\left(B-X_{1}^{T} A_{0} X_{1}\right)\right\| . \tag{5}
\end{align*}
$$

Let the singular value decomposition of the matrix $X_{2}$ be

$$
X_{2}=P\left[\begin{array}{cc}
\Omega & 0  \tag{6}\\
0 & 0
\end{array}\right] Q^{T},
$$

where $P=\left[P_{1}, P_{2}\right] \in \mathbf{O R}^{(n-r) \times(n-r)}, V=\left[Q_{1}, Q_{2}\right] \in$ $\mathbf{O R}^{p \times p}, \Omega=\operatorname{diag}\left(\omega_{1}, \cdots, \omega_{s}\right), \omega_{i}>0(i=1, \cdots, s), s=$ $\operatorname{rank}\left(X_{2}\right), P_{1} \in \mathbf{R}^{(n-r) \times s}, Q_{1} \in \mathbf{R}^{p \times s}$, and let

$$
P^{T} H P=\left[\begin{array}{cc}
H_{11} & H_{12} \\
H_{13} & H_{14} \\
s & n-r-s
\end{array} \quad \begin{array}{c}
s \\
\end{array} \quad \begin{array}{c} 
\\
s-r-s
\end{array} .\right.
$$

Then the relation of (5) is equivalent to

$$
\begin{align*}
& \left\|X^{T} A X-B\right\|^{2} \\
= & \| \Omega H_{11} \Omega+\Omega P_{1}^{T} G X_{1} Q_{1} \\
+ & Q_{1}^{T} X_{1}^{T} F P_{1} \Omega-Q_{1}^{T}\left(B-X_{1}^{T} A_{0} X_{1}\right) Q_{1} \|^{2} \\
+ & \left\|\Omega P_{1}^{T} G X_{1} Q_{2}-Q_{1}^{T}\left(B-X_{1}^{T} A_{0} X_{1}\right) Q_{2}\right\|^{2}  \tag{7}\\
+ & \left\|Q_{2}^{T} X_{1}^{T} F P_{1} \Omega-Q_{2}^{T}\left(B-X_{1}^{T} A_{0} X_{1}\right) Q_{1}\right\|^{2} \\
+ & \left\|Q_{2}^{T}\left(B-X_{1}^{T} A_{0} X_{1}\right) Q_{2}\right\|^{2} .
\end{align*}
$$

It follows from (7) that $\left\|X^{T} A X-B\right\|=$ min if and only if

$$
\begin{gather*}
H_{11}=\Omega^{-1}\left[Q_{1}^{T}\left(B-X_{1}^{T} A_{0} X_{1}\right) Q_{1}-\right. \\
\left.\quad \Omega P_{1}^{T} G X_{1} Q_{1}-Q_{1}^{T} X_{1}^{T} F P_{1} \Omega\right] \Omega^{-1},  \tag{8}\\
\left\|\Omega P_{1}^{T} G X_{1} Q_{2}-Q_{1}^{T}\left(B-X_{1}^{T} A_{0} X_{1}\right) Q_{2}\right\|=\min \tag{9}
\end{gather*}
$$

and

$$
\begin{equation*}
\left\|Q_{2}^{T} X_{1}^{T} F P_{1} \Omega-Q_{2}^{T}\left(B-X_{1}^{T} A_{0} X_{1}\right) Q_{1}\right\|=\min . \tag{10}
\end{equation*}
$$

Assume that the singular value decomposition of the matrix $X_{1} Q_{2}$ is

$$
X_{1} Q_{2}=U\left[\begin{array}{ll}
\Sigma & 0  \tag{11}\\
0 & 0
\end{array}\right] V^{T},
$$

where $U=\left[U_{1}, U_{2}\right] \in \mathbf{O R}^{r \times r}, V=\left[V_{1}, V_{2}\right] \in$ $\mathbf{O R}^{(p-s) \times(p-s)}, \quad \Sigma=\operatorname{diag}\left(\sigma_{1}, \cdots, \sigma_{t}\right), \quad \sigma_{i}>0(i=$ $1, \cdots, t), t=\operatorname{rank}\left(X_{1} Q_{2}\right), U_{1} \in \mathbf{R}^{r \times t}, \quad V_{1} \in \mathbf{R}^{(p-s) \times t}$. Solving the minimization problems (9) and (10) by means of Lemma 1, we obtain

$$
\begin{align*}
& G=G_{0}+P_{2} L_{1}+J_{1} U_{2}^{T},  \tag{12}\\
& F=F_{0}+U_{2} L_{2}+J_{2} P_{2}^{T}, \tag{13}
\end{align*}
$$

where

$$
\begin{align*}
& G_{0}=P_{1} \Omega^{-1} Q_{1}^{T}\left(B-X_{1}^{T} A_{0} X_{1}\right) Q_{2}\left(X_{1} Q_{2}\right)^{+},  \tag{14}\\
& F_{0}=\left(Q_{2}^{T} X_{1}^{T}\right)^{+} Q_{2}^{T}\left(B-X_{1}^{T} A_{0} X_{1}\right) Q_{1} \Omega^{-1} P_{1}^{T},
\end{align*}
$$

and $J_{1} \in \mathbf{R}^{(n-r) \times(r-t)}, L_{1} \in \mathbf{R}^{(n-r-s) \times r}, L_{2} \in$ $\mathbf{R}^{(r-t) \times(n-r)}, J_{2} \in \mathbf{R}^{r \times(n-r-s)}$ are arbitrary matrices.
Substituting (12) and (13) into (8) yields

$$
\begin{equation*}
H_{11}=H_{110}-P_{1}^{T} J_{1} U_{2}^{T} X_{1} Q_{1} \Omega^{-1}-\Omega^{-1} Q_{1}^{T} X_{1}^{T} U_{2} L_{2} P_{1} \tag{15}
\end{equation*}
$$

where

$$
\begin{align*}
H_{110}= & \Omega^{-1} Q_{1}^{T}\left(B-X_{1}^{T} A_{0} X_{1}\right) Q_{1} \Omega^{-1}  \tag{16}\\
& -P_{1}^{T} G_{0} X_{1} Q_{1} \Omega^{-1}-\Omega^{-1} Q_{1}^{T} X_{1}^{T} F_{0} P_{1} .
\end{align*}
$$

By now, we have proved the following result.
Theorem 1: Suppose that $X \in \mathbf{R}^{n \times p}, B \in \mathbf{R}^{p \times p}$ and $A_{0} \in \mathbf{R}^{r \times r}$. Let the partition of the matrix $X$ be (3), and the SVDs of the matrices $X_{2}$ and $X_{1} Q_{2}$ be given by (6) and (11), respectively. Then the solution set $\mathbf{S}_{\mathbf{E}}$ of Problem I can be expressed as

$$
\mathbf{S}_{\mathbf{E}}=\left\{A \in \mathbf{R}^{n \times n} \left\lvert\, A=\left[\begin{array}{cc}
A_{0} & F \\
G & H
\end{array}\right]\right.\right\}
$$

where

$$
H=P\left[\begin{array}{ll}
H_{11} & H_{12} \\
H_{13} & H_{14}
\end{array}\right] P^{T},
$$

$G, F, G_{0}, F_{0}, H_{11}$ are given by (12), (13), (14) and (15), respectively, and $L_{1}, L_{2}, J_{1}, J_{2}, H_{12}, H_{13}, H_{14}$ are arbitrary matrices.

From (7) and Theorem 1, we can easily obtain the following result [12].

Corollary 2: Under the same assumptions as in Theorem 1. Then the matrix equation

$$
\begin{equation*}
X^{T} A X=B, A([1, r])=A_{0} \tag{17}
\end{equation*}
$$

have a solution $A \in \mathbf{R}^{n \times n}$ if and only if

$$
\begin{array}{r}
Q_{2}^{T}\left(B-X_{1}^{T} A_{0} X_{1}\right) Q_{2}=0, \\
Q_{1}^{T}\left(B-X_{1}^{T} A_{0} X_{1}\right) Q_{2} V_{2}=0 \\
V_{2}^{T} Q_{2}^{T}\left(B-X_{1}^{T} A_{0} X_{1}\right) Q_{1}=0, \tag{20}
\end{array}
$$

in which case, the general solution of the equation (17) is

$$
A=\left[\begin{array}{cc}
A_{0} & F_{0}+U_{2} L_{2}+J_{2} P_{2}^{T} \\
G_{0}+P_{2} L_{1}+J_{1} U_{2}^{T} & P\left[\begin{array}{cc}
H_{11} & H_{12} \\
H_{13} & H_{14}
\end{array}\right] P^{T}
\end{array}\right],
$$

where $G_{0}, F_{0}, H_{11}$ are given by (14) and (15), respectively, and $L_{1}, L_{2}, J_{1}, J_{2}, H_{12}, H_{13}, H_{14}$ are arbitrary matrices.

## III. The solution of Problem II

It is easy to verify that $\mathbf{S}_{\mathbf{E}}$ is a closed convex subset of $\mathbf{R}^{n \times n}$. From the best approximation theorem (see [1]), we know there exists a unique solution $\hat{A}$ in $\mathbf{S}_{\mathbf{E}}$ such that (2) holds.

We now focus our attention on seeking the unique solution $\hat{A}$ in $\mathbf{S}_{\mathbf{E}}$. For the given matrix $\tilde{A} \in \mathbf{R}^{n \times n}$ with $\tilde{A}([1, r])=A_{0}$, write

$$
\tilde{A}=\left[\begin{array}{cc}
A_{0} & \tilde{F}  \tag{21}\\
\tilde{G} & \tilde{H}
\end{array}\right] \quad \begin{gathered}
r \\
r
\end{gathered} \begin{gathered}
n-r
\end{gathered}
$$

and

$$
P^{T} \tilde{H} P=\left[\begin{array}{cc}
\tilde{H}_{11} & \tilde{H}_{12}  \tag{22}\\
\tilde{H}_{13} & \tilde{H}_{14}
\end{array}\right]
$$

where $\tilde{H}_{11} \in \mathbf{R}^{s \times s}, \quad \tilde{H}_{14} \in \mathbf{R}^{(n-r-s) \times(n-r-s)}$.
For any matrix $A \in \mathbf{S}_{\mathbf{E}}$, by using (12), (13), (15), (21) and (22), we have

$$
\begin{align*}
& \|A-\tilde{A}\|^{2} \\
= & \| P_{1}^{T} J_{1} U_{2}^{T} X_{1} Q_{1} \Omega^{-1}+\Omega^{-1} Q_{1}^{T} X_{1}^{T} U_{2} L_{2} P_{1} \\
- & \left(H_{110}-\tilde{H}_{11}\right) \|^{2} \\
+ & \left\|U_{2} L_{2}+J_{2} P_{2}^{T}-\left(\tilde{F}-F_{0}\right)\right\|^{2} \\
+ & \left\|P_{2} L_{1}+J_{1} U_{2}^{T}-\left(\tilde{G}-G_{0}\right)\right\|^{2} \\
+ & \left\|H_{12}-\tilde{H}_{12}\right\|^{2}+\left\|H_{13}-\tilde{H}_{13}\right\|^{2}+\left\|H_{14}-\tilde{H}_{14}\right\|^{2} . \tag{23}
\end{align*}
$$

Notice that

$$
\begin{align*}
& \left\|U_{2} L_{2}+J_{2} P_{2}^{T}-\left(\tilde{F}-F_{0}\right)\right\|^{2} \\
= & \left\|U_{2} L_{2}+\left[0, J_{2}\right]\left[\begin{array}{c}
P_{1}^{T} \\
P_{2}^{T}
\end{array}\right]-\left(\tilde{F}-F_{0}\right)\right\|^{2}  \tag{24}\\
= & \left\|U_{2} L_{2} P_{1}-\left(\tilde{F}-F_{0}\right) P_{1}\right\|^{2} \\
+ & \left\|U_{2} L_{2} P_{2}+J_{2}-\left(\tilde{F}-F_{0}\right) P_{2}\right\|^{2} .
\end{align*}
$$

Likewise,

$$
\begin{align*}
& \left\|P_{2} L_{1}+J_{1} U_{2}^{T}-\left(\tilde{G}-G_{0}\right)\right\|^{2} \\
= & \left\|P_{1}^{T} J_{1} U_{2}^{T}-P_{1}^{T}\left(\tilde{G}-G_{0}\right)\right\|^{2}  \tag{25}\\
+ & \left\|L_{1}+P_{2}^{T} J_{1} U_{2}^{T}-P_{2}^{T}\left(\tilde{G}-G_{0}\right)\right\|^{2} .
\end{align*}
$$

It follows from (23), (24) and (25) that $\|\tilde{A}-A\|=$ min if and only if

$$
\begin{equation*}
H_{12}=\tilde{H}_{12}, H_{13}=\tilde{H}_{13}, H_{14}=\tilde{H}_{14}, \tag{26}
\end{equation*}
$$

$J_{2}=\left(\tilde{F}-F_{0}\right) P_{2}-U_{2} L_{2} P_{2}, L_{1}=P_{2}^{T}\left(\tilde{G}-G_{0}\right)-P_{2}^{T} J_{1} U_{2}^{T}$,
and

$$
\begin{align*}
f\left(J_{1}, L_{2}\right) & =\left\|U_{2} L_{2} P_{1}-\tilde{C}\right\|^{2}+\left\|P_{1}^{T} J_{1} U_{2}^{T}-\tilde{D}\right\|^{2}  \tag{27}\\
& +\left\|P_{1}^{T} J_{1} S+S^{T} L_{2} P_{1}-\tilde{E}\right\|^{2}=\mathrm{min}, \tag{28}
\end{align*}
$$

where

$$
\begin{align*}
& \tilde{C}=\left(\tilde{F}-F_{0}\right) P_{1}, \tilde{D}=P_{1}^{T}\left(\tilde{G}-G_{0}\right), \\
& \tilde{E}=H_{110}-\tilde{H}_{11}, \quad S=U_{2}^{T} X_{1} Q_{1} \Omega^{-1} . \tag{29}
\end{align*}
$$

From (28) we have

$$
\begin{aligned}
& f\left(J_{1}, L_{2}\right)=\operatorname{trace}\left(P_{1}^{T} L_{2}^{T} L_{2} P_{1}\right)-2 \operatorname{trace}\left(P_{1}^{T} L_{2}^{T} U_{2}^{T} \tilde{C}\right) \\
& +\operatorname{trace}\left(\tilde{C}^{T} \tilde{C}\right)+\operatorname{trace}\left(J_{1}^{T} P_{1} P_{1}^{T} J_{1}\right) \\
& -2 \operatorname{trace}\left(U_{2} J_{1}^{T} P_{1} \tilde{D}\right)+\operatorname{trace}\left(\tilde{D}^{T} \tilde{D}\right) \\
& +\operatorname{trace}\left(S^{T} J_{1}^{T} P_{1} P_{1}^{T} J_{1} S\right)+\operatorname{trace}\left(P_{1}^{T} L_{2}^{T} S S^{T} L_{2} P_{1}\right) \\
& +\operatorname{trace}\left(\tilde{E}^{T} \tilde{E}\right)+2 \operatorname{trace}\left(S^{T} J_{1}^{T} P_{1} S^{T} L_{2} P_{1}\right) \\
& -2 \operatorname{trace}\left(P_{1}^{T} L_{2}^{T} S \tilde{E}\right)-2 \operatorname{trace}\left(S^{T} J_{1}^{T} P_{1} \tilde{E}\right) .
\end{aligned}
$$

Consequently,

$$
\begin{aligned}
& \frac{\partial f\left(J_{1}, L_{2}\right)}{\partial J_{1}}=2 P_{1} P_{1}^{T} J_{1}+2 P_{1} P_{1}^{T} J_{1} S S^{T} \\
& \quad+2 P_{1} S^{T} L_{2} P_{1} S^{T}-2 P_{1} \tilde{E} S^{T}-2 P_{1} \tilde{D} U_{2}, \\
& \frac{\partial f\left(J_{1}, L_{2}\right)}{\partial L_{2}}=2 L_{2} P_{1} P_{1}^{T}+2 S P_{1}^{T} J_{1} S P_{1}^{T} \\
& \quad+2 S S^{T} L_{2} P_{1} P_{1}^{T}-2 U_{2}^{T} \tilde{C} P_{1}^{T}-2 S E P_{1}^{T} .
\end{aligned}
$$

Setting $\frac{\partial f\left(J_{1}, L_{2}\right)}{\partial J_{1}}=0$ and $\frac{\partial f\left(J_{1}, L_{2}\right)}{\partial L_{2}}=0$, we obtain

$$
\begin{gather*}
P_{1}^{T} J_{1}+P_{1}^{T} J_{1} S S^{T}+S^{T} L_{2} P_{1} S^{T}=\tilde{E} S^{T}+\tilde{D} U_{2},  \tag{30}\\
L_{2} P_{1}+S P_{1}^{T} J_{1} S+S S^{T} L_{2} P_{1}=U_{2}^{T} \tilde{C}+S \tilde{E} . \tag{31}
\end{gather*}
$$

Let the singular value decomposition of the matrix $S$ be

$$
S=T\left[\begin{array}{ll}
\Gamma & 0  \tag{32}\\
0 & 0
\end{array}\right] W^{T}
$$

where $T=\left[T_{1}, T_{2}\right] \in \mathbf{O R}^{(r-t) \times(r-t)}, W=\left[W_{1}, W_{2}\right] \in$ $\mathbf{O R}^{s \times s}, \Gamma=\operatorname{diag}\left(\gamma_{1}, \cdots, \gamma_{f}\right), \gamma_{i}>0(i=1, \cdots, f), f=$ $\operatorname{rank}(S), T_{1} \in \mathbf{R}^{(r-t) \times f}, W_{1} \in \mathbf{R}^{s \times f}$. Put

$$
\begin{gather*}
W^{T} P_{1}^{T} J_{1} T=\left[\begin{array}{cc}
J_{11} & J_{12} \\
J_{13} & J_{14}
\end{array}\right] \quad \begin{array}{c}
f \\
f
\end{array} \quad r-t-f,  \tag{33}\\
T^{T} L_{2} P_{1} W=\left[\begin{array}{cc}
L_{21} & L_{22} \\
L_{23} & L_{24} \\
f & s-f
\end{array} \quad \begin{array}{c}
f-t-f .
\end{array}\right. \tag{34}
\end{gather*}
$$

After some algebraic manipulations, the equation of (30) is equivalent to

$$
\begin{aligned}
J_{11}+J_{11} \Gamma^{2}+\Gamma L_{21} \Gamma & =W_{1}^{T}\left(\tilde{D} U_{2}+\tilde{E} S^{T}\right) T_{1}, \\
J_{13}+J_{13} \Gamma^{2} & =W_{2}^{T}\left(\tilde{D} U_{2}+\tilde{E} S^{T}\right) T_{1}, \\
J_{12} & =W_{1}^{T}\left(\tilde{D} U_{2}+\tilde{E} S^{T}\right) T_{2}, \\
J_{14} & =W_{2}^{T}\left(\tilde{D} U_{2}+\tilde{E} S^{T}\right) T_{2},
\end{aligned}
$$

and the equation of (31) is equivalent to

$$
\begin{align*}
L_{21}+\Gamma^{2} L_{21}+\Gamma J_{11} \Gamma & =T_{1}^{T}\left(U_{2}^{T} \tilde{C}+S \tilde{E}\right) W_{1}  \tag{39}\\
L_{22}+\Gamma^{2} L_{22} & =T_{1}^{T}\left(U_{2}^{T} \tilde{C}+S \tilde{E}\right) W_{2}  \tag{40}\\
L_{23} & =T_{2}^{T}\left(U_{2}^{T} \tilde{C}+S \tilde{E}\right) W_{1}  \tag{41}\\
L_{24} & =T_{2}^{T}\left(U_{2}^{T} \tilde{C}+S \tilde{E}\right) W_{2} \tag{42}
\end{align*}
$$

Let $J_{11}=\left[j_{i k}\right] \in \mathbf{R}^{f \times f}, L_{21}=\left[l_{i k}\right] \in \mathbf{R}^{f \times f}, W_{1}^{T}\left(\tilde{D} U_{2}+\right.$ $\left.\tilde{E} S^{T}\right) T_{1}=\left[d_{i k}\right] \in \mathbf{R}^{f \times f}$ and $T_{1}^{T}\left(U_{2}^{T} \tilde{C}+S \tilde{E}\right) W_{1}=\left[c_{i k}\right] \in$ $\mathbf{R}^{f \times f}$. From (35) and (39) we have

$$
\begin{aligned}
j_{i k}+j_{i k} \gamma_{k}^{2}+\gamma_{i} l_{i k} \gamma_{k} & =d_{i k}, \quad i, k=1, \cdots, f \\
l_{i k}+\gamma_{i}^{2} l_{i k}+\gamma_{i} j_{i k} \gamma_{k} & =c_{i k}, \quad i, k=1, \cdots, f
\end{aligned}
$$

Solving these linear equations with respect to $l_{i k}, j_{i k}(i, k=$ $1, \cdots, f$ ), we obtain
$l_{i k}=\frac{1}{1+\gamma_{i}^{2}+\gamma_{k}^{2}}\left(c_{i k}\left(1+\gamma_{k}^{2}\right)-\gamma_{i} d_{i k} \gamma_{k}\right)$, for $i, k=1, \cdots, f$,
$j_{i k}=\frac{1}{1+\gamma_{i}^{2}+\gamma_{k}^{2}}\left(\left(1+\gamma_{i}^{2}\right) d_{i k}-\gamma_{i} c_{i k} \gamma_{k}\right)$, for $i, k=1, \cdots, f$,
Let $\Phi=\left[\frac{1}{1+\gamma_{i}^{2}+\gamma_{k}^{2}}\right] \in \mathbf{R}^{f \times f}$, then (43) and (44) may be expressed as

$$
\begin{align*}
L_{21}= & \Phi *\left[T_{1}^{T}\left(U_{2}^{T} \tilde{C}+S \tilde{E}\right) W_{1}\left(I_{f}+\Gamma^{2}\right)\right.  \tag{45}\\
& \left.-\Gamma W_{1}^{T}\left(\tilde{D} U_{2}+\tilde{E} S^{T}\right) T_{1} \Gamma\right] \\
J_{11}= & \Phi *\left[\left(\left(I_{f}+\Gamma^{2}\right) W_{1}^{T}\left(\tilde{D} U_{2}+\tilde{E} S^{T}\right) T_{1}\right.\right. \\
& \left.-\Gamma T_{1}^{T}\left(U_{2}^{T} \tilde{C}+S \tilde{E}\right) W_{1} \Gamma\right] . \tag{46}
\end{align*}
$$

From (36) and (40), we have

$$
\begin{align*}
J_{13} & =W_{2}^{T}\left(\tilde{D} U_{2}+\tilde{E} S^{T}\right) T_{1}\left(I_{f}+\Gamma^{2}\right)^{-1}  \tag{47}\\
L_{22} & =\left(I_{f}+\Gamma^{2}\right)^{-1} T_{1}^{T}\left(U_{2}^{T} \tilde{C}+S \tilde{E}\right) W_{2} \tag{48}
\end{align*}
$$

Thus, from (33) and (34) we have

$$
\begin{align*}
& P_{1}^{T} J_{1}=W\left[\begin{array}{ll}
J_{11} & J_{12} \\
J_{13} & J_{14}
\end{array}\right] T^{T},  \tag{49}\\
& L_{2} P_{1}=T\left[\begin{array}{ll}
L_{21} & L_{22} \\
L_{23} & L_{24}
\end{array}\right] W^{T}, \tag{50}
\end{align*}
$$

where $J_{11}, J_{12}, J_{13}$ and $J_{14}$ are given by (46), (37), (47) and (38), respectively, and $L_{21}, L_{22}, L_{23}$ and $L_{24}$ are given by (45), (48), (41) and (42), respectively.

Inserting $J_{2}, L_{1}$ in (27) into (12) and (13), we obtain

$$
\begin{aligned}
& F=F_{0} P_{1} P_{1}^{T}+\tilde{F} P_{2} P_{2}^{T}+U_{2} L_{2} P_{1} P_{1}^{T} \\
& G=P_{1} P_{1}^{T} G_{0}+P_{2} P_{2}^{T} \tilde{G}+P_{1} P_{1}^{T} J_{1} U_{2}^{T}
\end{aligned}
$$

Summing up above discussion, we have proved the following result.
Theorem 3: For the given matrix $\tilde{A} \in \mathbf{R}^{n \times n}$ with $\tilde{A}([1, r])=A_{0}$, then the matrix best approximation problem (2) has a unique solution $\hat{A} \in \mathbf{S}_{\mathbf{E}}$. Furthermore, let the partition of $\tilde{A}$ be (21) and $P^{T} \tilde{H} P$ be (22). Then the unique solution of Problem II can be expressed as

$$
\hat{A}=\left[\begin{array}{cc}
A_{0} & \hat{F}  \tag{51}\\
\hat{G} & \hat{H}
\end{array}\right]
$$

where

$$
\begin{gathered}
\hat{F}=F_{0} P_{1} P_{1}^{T}+\tilde{F} P_{2} P_{2}^{T}+U_{2} L_{2} P_{1} P_{1}^{T} \\
\hat{G}=P_{1} P_{1}^{T} G_{0}+P_{2} P_{2}^{T} \tilde{G}+P_{1} P_{1}^{T} J_{1} U_{2}^{T} \\
\hat{H}=P\left[\begin{array}{cc}
H_{11} & \tilde{H}_{12} \\
\tilde{H}_{13} & \tilde{H}_{14}
\end{array}\right] P^{T},
\end{gathered}
$$

$P_{1}^{T} J_{1}, L_{2} P_{1}$ and $H_{11}$ are given by (49), (50) and (15), respectively.

## IV. A Numerical Example

According to the previous discussion, we now give a numerical algorithm for solving Problem I and Problem II as follows.

## Algorithm 1.

1) Input matrices $X, B, A_{0}$, and $\tilde{A}$;
2) Form the matrix $X_{1}, X_{2}$ according to (3);
3) Compute the SVD (6) of the matrix $X_{2}$ and then compute the SVD (11) of $X_{1} Q_{2}$;
4) Compute $G_{0}, F_{0}$ and $H_{110}$ by (14) and (16), respectively;
5) Partition matrix $\tilde{A}$ as in (21) to get $\tilde{F}, \tilde{G}, \tilde{H}$;
6) Compute $\tilde{H}_{1 j}, j=1,2,3,4$ by (22);
7) Compute the matrices $\tilde{C}, \tilde{D}, \tilde{E}$ and $S$ by (29);
8) Compute the SVD (32) of the matrix $S$;
9) Compute $J_{11}, J_{12}, J_{13}$ and $J_{14}$ are given by (46), (37), (47) and (38), respectively;
10) Compute $L_{21}, L_{22}, L_{23}$ and $L_{24}$ are given by (45), (48), (41) and (42), respectively;
11) Compute $P_{1}^{T} J_{1}, L_{2} P_{1}$ by (49) and (50), and then compute $H_{11}$ by (15);
12) Compute the unique solution $\hat{A}$ of Problem II according to (51).
Example 1. (An example for updating the mass matrix of a vibrating system described in (1)).
Let $A_{0}, X, B$ and $\tilde{A}$ be given by

$$
\begin{aligned}
A_{0} & =\left[\begin{array}{cccc}
0.3333 & 0.1667 & 0 & 0 \\
0.1667 & 0.6667 & 0.1667 & 0 \\
0 & 0.1667 & 0.6667 & 0.1667 \\
0 & 0 & 0.1667 & 0.6667
\end{array}\right], \\
X & =\left[\begin{array}{ccc}
39.230 & 347.67 & -45.500 \\
-22.312 & -289.62 & 54.211 \\
68.151 & 640.05 & -90.167 \\
-61.888 & -640.58 & 100.18 \\
206.84 & 491.56 & 141.90 \\
-427.7 & -1474.9 & -161.45 \\
315.58 & 1375.1 & 36.539 \\
-184.24 & -993.56 & 33.587
\end{array}\right]
\end{aligned}
$$

$B=I_{3}$ and

$$
\tilde{A}=\left[\begin{array}{rrrr}
0.3333 & 0.1667 & 0 & 0 \\
0.1667 & 0.6667 & 0.1667 & 0 \\
0 & 0.1667 & 0.6667 & 0.1667 \\
0 & 0 & 0.1667 & 0.6667 \\
0.1000 & 0.4500 & 0.1800 & 0.4000 \\
0.3500 & 0.7000 & 0.2100 & 0.3000 \\
0.6000 & 0.8000 & 0.3900 & 0.2000 \\
0.2000 & 0.2800 & 0.4700 & 0.1000 \\
0.1000 & 0.3500 & 0.6000 & 0.2000 \\
0.4500 & 0.7000 & 0.8000 & 0.2800 \\
0.1800 & 0.2100 & 0.3900 & 0.4700 \\
0.4000 & 0.3000 & 0.2000 & 0.1000 \\
0.1200 & 0.4800 & 0.4680 & 0.3600 \\
0.4800 & 0.8400 & 0.6060 & 0.3480 \\
0.4680 & 0.6060 & 0.4680 & 0.4020 \\
0.3600 & 0.3480 & 0.4020 & 0.1200
\end{array}\right],
$$

According to algorithm 1 we obtain the unique solution of Problem II as follows.

$$
\hat{A}=\left[\begin{array}{rrrr}
0.3333 & 0.1667 & 0 & 0 \\
0.1667 & 0.6667 & 0.1667 & 0 \\
0 & 0.1667 & 0.6667 & 0.1667 \\
0 & 0 & 0.1667 & 0.6667 \\
0.1224 & 0.3938 & 0.2359 & 0.3212 \\
0.3447 & 0.7322 & 0.1893 & 0.3376 \\
0.5783 & 0.8287 & 0.3459 & 0.2507 \\
0.2297 & 0.2283 & 0.5353 & 0.0182
\end{array}\right.
$$

$\left.\begin{array}{rrrr}0.0498 & 0.4734 & 0.4967 & 0.2684 \\ 0.3744 & 0.7667 & 0.8069 & 0.2387 \\ 0.3182 & 0.0434 & 0.4384 & 0.4913 \\ 0.3728 & 0.2461 & 0.3087 & -0.0093 \\ 0.0684 & 0.5068 & 0.4982 & 0.3091 \\ 0.5068 & 0.8209 & 0.5974 & 0.3681 \\ 0.4982 & 0.5974 & 0.4406 & 0.4404 \\ 0.3091 & 0.3681 & 0.4404 & 0.0622\end{array}\right]$,

Although we do not need to verify the consistency conditions (18)-(20), we note that the conditions (18)-(20) do hold for this example. Furthermore, we can figure out

$$
\left\|X^{T} \hat{A} X-B\right\|=7.2881 e-010,\|\tilde{A}-\hat{A}\|=0.4216
$$
