

# Multiple Shoot Formation of *Paphiopedilum* 'Delrosi'

Aree Thongpukdee, Ekasit Nisayan, and Chockpisit Thepsithar

**Abstract**—Shoots, with three leaves, of *Paphiopedilum* 'Delrosi' were used as explants for multiple shoot induction. Modified Hyponex medium was supplemented with thidiazuron (TDZ), N<sup>6</sup>-benzyladenine (BA) or kinetin (Kn) alone and in combinations with 2,4-dichlorophenoxyacetic acid (2,4-D). All explants were cultured for 15 weeks. It was found that TDZ alone at the concentration of 0.45µM or in combination with 4.52µM 2,4-D and 8.88µM BA in combination with 13.56µM 2,4-D promoted multiple shoots. The highest shoot sprouting efficiencies (80.0, 90.0 and 80.0%) and new shoot numbers (1.5, 1.3 and 1.1) were obtained, respectively. Fresh weight, height, numbers of leaf and root of new shoots and initial explants were discussed.

**Keywords**—*Paphiopedilum*, terrestrial orchids, *in vitro* culture, micropropagation, multiple shoot induction

## I. INTRODUCTION

*PAPHIOPEDILUM*, a member of the family Orchidaceae, is one of economic terrestrial orchids. *Paphiopedilum* 'Delrosi', a hybrid of *P. delenatii* × *P. rothschildianum*, is an attractive pot plant characterized by its white flower overlaid with variable amounts of raspberry color in longitudinal lines with petals and pouch painted in shade of pink [1]. Tissue culture techniques for *Paphiopedilum* have been developed for micropropagation in order to produce plants on demand in a large-scale to supply world market. Many researches on seed germination and appropriate media were reported [2]-[5]. Calli, protocorm-like bodies (PLBs), shoots and plantlets were induced from various types of explants such as seeds and seed-derived protocorms [6], [7], stem nodal explants [8], [9], leaf explants [10], shoots [9], [11]. However, there are a few reports on induction of multiple shoots from single shoots of *Paphiopedilum*.

This study reports the effects of plant growth regulators supplemented in a Hyponex culture medium on multiple shoot induction from seed-derived apical shoots of *Paphiopedilum* 'Delrosi'.

C. Thepsithar is with the Department of Biology, Faculty of Science, Silpakorn University, Sanamchan Palace, Muang, Nakhon Pathom, 73000, Thailand (e-mail: tchockpis@gmail.com, chockpis@su.ac.th).

## II. MATERIALS AND METHODS

### A. Plant Material

Three-leaf shoots, approximately 0.354 g. of *Paphiopedilum* 'Delrosi' (*P. delenatii* × *P. rothschildianum*) (Fig. 1 A) without root, from *in vitro* seedlings obtained from a commercial breeder were used as explants for multiple shoot induction.

### B. Media and Culture Conditions

A medium used for multiple shoot induction was Hyponex medium [11] containing 3g/L (6.5N-6P-19K) Hyponex, 100g/L potato homogenate, 2g/L peptone, 2.5g/L sucrose, 1g/L activated charcoal and 2.5g/L gelrite. The medium was supplemented with 0.45 or 2.25µM Thidiazuron (TDZ) or 4.44 or 8.88µM N<sup>6</sup>-benzyladenine (BA) or 2.32 or 4.65µM kinetin (Kn) alone or in combinations with 4.52 or 13.56µM 2,4-dichlorophenoxyacetic acid (2,4-D). The pH of all media was adjusted to 5.4 prior to adding gelrite and autoclaving. Explants were cultured, in 240mL glass jars containing 50mL of culture medium, for 15 weeks. All cultured were incubated at 24±1°C and under a 16-h photoperiod at 35–40µmol·m<sup>-2</sup>·s<sup>-1</sup> provided by cool-white fluorescent lamps.

### C. Statistical Analysis

Percentage of explants induced new shoots, whole fresh weights (FWs) of new shoots and original explants, numbers of new regenerated plantlets were recorded after 15 weeks. Each treatment was replicated 13 times. The completely randomized design (CRD) was used as the experimental design and data were analysed by Duncan's new multiple range test at  $P = 0.05$  [12].

## III. RESULTS

### A. Effects of Plant Growth Regulators Supplemented in Hyponex Medium on Multiple Shoot Formation of *Paphiopedilum* 'Delrosi' Shoots

The high percentage of explants produced multiple shoots was in the range of 80 – 90% obtained from Hyponex medium supplemented with 0.45µM TDZ (80%) or 0.45µM TDZ in combination with 4.52µM 2,4-D (90%) or 8.88µM BA in combination with 13.56µM 2,4-D (80%). New regenerated shoots were 1.5, 1.3 and 1.1 shoots, respectively (Table I; Figs. 1B, 1C, and 1D). Although the highest numbers of new shoots per explant were found from 0.45µM TDZ, the higher whole fresh weights of new regenerated shoots and number of roots per new shoot were obtained from 0.45µM TDZ in

combination with 4.52 $\mu$ M 2,4-D (210.8mg. and 1.3 roots) (Fig 1C) and 8.88 $\mu$ M BA in combination with 13.56 $\mu$ M 2,4-D (268.4mg. and 1.3 roots) (Fig 1D), than whole fresh weights and number of root per new shoot from 0.45 $\mu$ M TDZ (109.9mg and 0.6 root) (Fig. 1B). For other treatments of plant growth regulators, except for 2.32 $\mu$ M Kn in combination with 4.52 $\mu$ M 2,4-D, 10–60% of explants produced new shoots with 0.1–1.5 shoots per explants were obtained. There was no new shoot found from the medium containing 2.32 $\mu$ M Kn in combination with 4.52 $\mu$ M 2,4-D. The medium without plant growth regulator (control) gave 30% of explants produced new shoots with 0.3 new shoot per explants and 15.8mg whole fresh weights of new shoots with 0.2 root per new shoot (Table I; Fig. 1E).

### B. Effects of Plant Growth Regulators Supplemented in Hyponex Medium on Growth of Original Shoot Explants of *Paphiopedilum* 'Delrosi'

Original shoots from all treatments were health with 6.3–7.2 green leaves and 6.2–8.3 regenerated roots (Fig. 1C) compared to control set without plant growth regulator, 6.0 leaves and 5.7 roots) (Fig. 1B, 1C and 1D). However, among the three selected treatments that provided the high regeneration of new shoots, the higher whole FWs (2129.3mg and 2714.7mg.), shoot FWs (1149.9mg and 1553.7mg.) of original shoot explants were found from medium supplemented with 0.45 $\mu$ M TDZ in combination with 4.52 $\mu$ M 2,4-D (Table I; Fig. 1C) and 8.88 $\mu$ M BA in combination with 13.56 $\mu$ M 2,4-D (Table I; Fig. 1D) than whole FW (1942.5mg) and Shoot FW (936.1mg) from medium supplemented with 0.45 $\mu$ M TDZ (Table II; Fig. 1D) .

## IV. DISCUSSIONS

In general, seeds are still commonly used for micropropagation of *Paphiopedilum* orchids due to multiplication rate from shoot explants is very low. Slow growth and low multiplication rate are the important limiting factor of *in vitro* culture of slipper orchids. For *in vitro* culture media used, a modified half-strength Murashige and Skoog (MS) medium [13] and a modified MS medium were used for *Paphiopedilum* orchids [6], [8]-[10] while a quarter-strength MS medium and Hyponex-peptone medium were used for *Cyperidium* orchids [14], [15].

For plant growth regulations used, Huang et al. reported that a modified MS medium supplemented with 13 $\mu\text{M}$  BA in combinations with 1.6 $\mu\text{M}$  1-naphthaleneacetic acid (NAA), 0.15 $\mu\text{M}$  adenine sulfate was suitable for promoting shoot and root formation from apical shoots of *Paphiopedilum* hybrids while TDZ inhibited shoot proliferation and rooting [16]. However, Chen et al. [8] presented that 0.45 $\mu\text{M}$  TDZ and 4.52 $\mu\text{M}$  2,4-D supplemented in a modified half-strength MS medium enhanced the percentage of explants produced new regenerated shoots from stem nodal explants (66.7 and 80%) of *Paphiopedilum philippenense* hybrids. For numbers of regenerated shoots per explant, the combination of 0.45 $\mu\text{M}$  TDZ with 4.52 $\mu\text{M}$  2,4-D and 0.45 $\mu\text{M}$  TDZ alone were appropriate for hybrid PH59 and PH60 with 1.6 and 7 new shoots, respectively [8]. The similar results were found from this study. The growth of shoots was very slow and numbers of new regenerated shoots were limited with the low rate of regeneration. The suitable medium, types and concentrations of plant growth regulators varied depending on types of explants, species and hybrids.

## V. CONCLUSIONS

The most effective growth regulator for inducing multiple shoots of *Paphiopedilum* 'Delrosi' was TDZ at the low concentration (0.45  $\mu\text{M}$ ) supplemented in Hyponex medium.

## ACKNOWLEDGEMENT
