

Taxonomic and Faunistic Data on the Genus *Triaspis* Haliday, 1835 (Hymenoptera: Braconidae: Brachistinae) from Turkey

Tülin Koldaş, Özlem Çetin Erdoğan, Ahmet Beyarslan

Turkish fauna.

Abstract—Brachistinae Förster, 1862 is a subfamily of the family Braconidae (order Hymenoptera) with about 410 species distributed all around the world. Brachistinae includes the genera, Eubazus Nees von Esenbeck 1814, Foersteria Szépligeti 1896, Chelostes van Achterberg 1990, Triaspis Haliday 1835 and Schizoprymnus Förster 1862. Members of the subfamily live as parasitoids on the families Curculionidae and Apionidae (Coleoptera), which also include very important agricultural pests. In generally, members of the genus *Triaspis* are poorly known biologically. The genus is represented by 37 species in the West Palearctic region and 118 species worldwide. Adult specimens of *Triaspis* were collected from as wide a range of habitats as possible at different altitudes in different parts of Turkey between 1982 and 2010. Samples collected from short plants using standard insect sweeping nets were transferred into tubes containing 70% ethanol and labelled following their preparations according to museum techniques. Seven *Triaspis* species have been reported from Turkey in this study. Five of these species are new to the fauna of Turkey.

Keywords—Braconidae, fauna, *Triaspis*, Hymenoptera, Turkey.

I. INTRODUCTION

THERE are over 410 known species of Brachistinae parasitoids. Brachistinae includes the genera, *Calyptites* Scudder, 1878, *Calyptoides* Cockerell, 1921, *Chelostes* van Achterberg 1990, *Cuniculobracon* van Achterberg & Falcó, 2001, *Dicyrtaspis* van Achterberg, 1980, *Eubazus* Nees, 1812, *Foersteria* Szépligeti 1896, *Nealiolus* Mason, 1974, *Polydegmon* Förster, 1862, *Schizoprymnus* Förster 1862, *Triaspis* Haliday 1835 [1]. The subfamily is represented by 9 genera in the West Palearctic region.

Members of Brachistinae live as parasitoids on the families Curculionidae and Apionidae (Coleoptera), which also include very important agricultural pests [2], [3].

The fauna of Turkey Brachistinae was studied rather well especially in the recent papers [3]-[8]. Although these studies have significantly contributed to the knowledge of *Triaspis* in Turkey, we still do not have adequate knowledge of the faunal composition. The aim of this study is to summarize records of the *Triaspis* spp. collected in Turkey and contribute to the

Ö. Çetin Erdoğan is with the Trakya University, Faculty of Science, Department of Biology, Edirne 22030 Turkey (corresponding author, phone +90 2842352825-1209; fax: +90 5284 2354010; e-mail: ozlemerdogan@trakya.edu.tr).

A. Beyarslan is with the Bitlis Eren University, Faculty of Arts and Science, Department of Biology, Bitlis, Turkey (e-mail: abeyars@gmail.com).

II. MATERIAL AND METHODS

Adult specimens of *Triaspis* were collected different locations in Turkey between 1982-2010. A sweeping-net was used for collecting specimens. They were then transferred into a hand-made aspirator and immediately killed with 70% alcohol. They were labelled following their preparations according to museum techniques. The distribution of *Triaspis* species in Turkey is mapped according to provinces (Figs. 1-7). The materials are deposited in the Zoological Museum of Department of Biology, Trakya University (TUZM).

III. RESULTS AND DISCUSSION

Seven species of *Triaspis* were identified. Five of these species are new to the fauna of Turkey: *Triaspis armeniaca* Tobias, 1976, *Triaspis pallipes* (Nees, 1816), *Triaspis sulcata* (Szépligeti, 1901), *Triaspis thoracica* (Curtis, 1860), *Triaspis xylophagi* Fischer, 1966
