# A note on the minimum cardinality of critical sets of inertias for irreducible zero-nonzero patterns of order 4 

Ber-Lin Yu and Ting-Zhu Huang

Abstract-If there exists a nonempty, proper subset $\mathcal{S}$ of the set of all $(n+1)(n+2) / 2$ inertias such that $\mathcal{S} \subseteq i(\mathcal{A})$ is sufficient for any $n \times n$ zero-nonzero pattern $\mathcal{A}$ to be inertially arbitrary, then $\mathcal{S}$ is called a critical set of inertias for zero-nonzero patterns of order $n$. If no proper subset of $\mathcal{S}$ is a critical set, then $\mathcal{S}$ is called a minimal critical set of inertias. In [Kim, Olesky and Driessche, Critical sets of inertias for matrix patterns, Linear and Multilinear Algebra, 57 (3) (2009) 293-306], identifying all minimal critical sets of inertias for $n \times n$ zero-nonzero patterns with $n \geq 3$ and the minimum cardinality of such a set are posed as two open questions by Kim, Olesky and Driessche. In this note, the minimum cardinality of all critical sets of inertias for $4 \times 4$ irreducible zero-nonzero patterns is identified.

Keywords-Zero-nonzero pattern, Inertia, Critical set of inertias, Inertially arbitrary.

## I. Introduction

A$\mathrm{N} n \times n$ zero-nonzero pattern is a matrix $\mathcal{A}=\left[\alpha_{i j}\right]$ with entries in $\{*, 0\}$ where $*$ denotes a nonzero real number. The set of all real matrices $A=\left[a_{i j}\right]$ such that $a_{i j} \neq 0$ if and only if $\alpha_{i j}=*$ for all $i$ and $j$. If $A \in Q(\mathcal{A})$, then $A$ is a realization of $\mathcal{A}$. A subpattern of an $n \times n$ zero-nonzero pattern $\mathcal{A}=\left[\alpha_{i j}\right]$ is an $n \times n$ zero-nonzero pattern $\mathcal{B}=\left[\beta_{i j}\right]$ such that $\beta_{i j}=0$ whenever $\alpha_{i j}=0$. If $\mathcal{B}$ is a subpattern of $\mathcal{A}$, then $\mathcal{A}$ is a superpattern of $\mathcal{B}$. A zero-nonzero pattern $\mathcal{A}$ is reducible if there is a permutation matrix $\mathcal{P}$ such that

$$
\mathcal{P} \mathcal{A} \mathcal{P}^{T}=\left(\begin{array}{cc}
\mathcal{A}_{11} & \mathcal{A}_{12} \\
0 & \mathcal{A}_{22}
\end{array}\right)
$$

where $\mathcal{A}_{11}$ and $\mathcal{A}_{22}$ are square matrices of order at least one. A pattern is irreducible if it is not reducible.

Recall that the inertia of a matrix $A$ is an ordered triple $i(A)=\left(n_{+}, n_{-}, n_{0}\right)$ where $n_{+}$is the number of eigenvalues of $A$ with positive real part, $n_{-}$is the number of eigenvalues of $A$ with negative real part, and $n_{0}$ is the number of eigenvalues of $A$ with zero real part. The inertial of zero-nonzero pattern $\mathcal{A}$ is $i(\mathcal{A})=\{i(A) \mid A \in Q(\mathcal{A})\}$. An $n \times n$ zero-nonzero pattern $\mathcal{A}$ is an inertially arbitrary pattern (IAP) if given any ordered triple $\left(n_{+}, n_{-}, n_{0}\right)$ of nonnegative integers with $n_{+}+$ $n_{-}+n_{0}=n$, there exists a real matrix $A \in Q(\mathcal{A})$ such that $i(A)=\left(n_{+}, n_{-}, n_{0}\right)$. Equivalently, $\mathcal{A}$ is an inertially arbitrary pattern if all the $(n+1)(n+2) / 2$ ordered triples $\left(n_{+}, n_{-}, n_{0}\right)$ of nonnegative integers with $n_{+}+n_{-}+n_{0}=n$ are in $i(\mathcal{A})$; see, e.g., [2-4].

Ber-Lin Yu and Ting-zhu Huang are with the School of Mathematical Science, University of Electronic Science and Technology of China, Chengdu, Sichuan, 610054 China e-mail: (berlin.yu@gmail.com).

Let $S$ be a nonempty, proper subset of the set of all $(n+$ 1) $(n+2) / 2$ inertias for any $n \times n$ zero-nonzero pattern $\mathcal{A}$. If $S \subseteq i(\mathcal{A})$ is sufficient for $\mathcal{A}$ to be inertially arbitrary, then $S$ is said to be a critical set of inertias for zero-nonzero patterns of order $n$ and if no proper subset of $S$ is a critical set of inertias, $S$ is said to be a minimal critical set of inertias for zero-nonzero patterns of order $n$; see, e.g., [3]. All minimal critical sets of inertias for irreducible zero-nonzero patterns of order 2 are identified. But as posed in [3], identifying all minimal critical sets of inertias for irreducible zero-nonzero patterns of order $n \geq 3$ is an open question. Also open is the minimum cardinality of such a set.

In this note, we concentrate on the minimum cardinality of all critical sets of inertias for irreducible zero-nonzero patterns of order 4. It is shown that the minimum cardinality of all critical sets of inertias for $4 \times 4$ irreducible zero-nonzero patterns is 3 .

## II. Preliminaries and main results

A zero-nonzero pattern $\mathcal{A}=\left[\alpha_{i j}\right]$ has an associated digraph $D(\mathcal{A})$ with vertex set $\{1,2, \ldots, n\}$ and for all $i$ and $j$, an arc from $i$ to $j$ if and only if $\alpha_{i j}$ is $*$. A (directed) simple cycle of length $k$ is a sequence of $k \operatorname{arcs}\left(i_{1}, i_{2}\right),\left(i_{2}, i_{3}\right), \ldots,\left(i_{k}, i_{1}\right)$ such that the vertices $i_{1}, \ldots, i_{k}$ are distinct. The digraph of a matrix is defined analogously; see, e.g., [1]. A digraph is strongly connected if for each vertex $i$ and every other vertex $j(\neq i)$, there is an oriented path from $i$ to $j$. A zero-nonzero pattern $\mathcal{A}$ is irreducible if and only if its digraph, $D(\mathcal{A})$, is strongly connected. For any digraph $D$, let $G(D)$ denote the underlying multigraph of $D$, i.e., the multigraph obtained from $D$ by ignoring the direction of each arc; see, e.g., [2].

The following lemma 1 was stated as Proposition 2 in [2], which is useful to determine whether a zero-nonzero pattern is inertially arbitray or not.

Lemma 1. Let $\mathcal{A}$ be an irreducible $n \times n$ zero-nonzero pattern and let $A \in Q(\mathcal{A})$. If $T$ is a direct subgraph of $D(\mathcal{A})$ such that $G(T)$ is a tree, then $\mathcal{A}$ has a realization that is diagonally similar to $A$ such that each entry corresponding to an arc of $T$ is 1 .

We proceed by showing the following zero-nonzero pattern is nearly inertially arbitrary.

Theorem 1 Let

$$
\mathcal{N}=\left(\begin{array}{cccc}
* & * & 0 & * \\
* & * & * & 0 \\
0 & 0 & 0 & * \\
* & 0 & * & 0
\end{array}\right) .
$$

Then the zero-nonzero pattern $\mathcal{N}$ allows all inertias $\left(n_{1}, n_{2}\right.$, $n_{3}$ ) with nonnegative integers $n_{1}, n_{2}$ and $n_{3}$ such that $n_{1}+$ $n_{2}+n_{3}=4$ except inertia $(0,0,4)$.

Proof. Since $(0,0,4) \in i(\mathcal{N})$ if and only if $\mathcal{N}$ allows some characteristic polynomial of the form

$$
x^{4}+(p+q) x^{2}+p q
$$

for $p, q \geq 0$. Suppose $A$ is a realization of $\mathcal{N}$. By Lemma 1 , without loss of generality, let

$$
A=\left(\begin{array}{llll}
a & 1 & 0 & b \\
c & d & 1 & 0 \\
0 & 0 & 0 & 1 \\
e & 0 & f & 0
\end{array}\right)
$$

for some nonzero real numbers $a, b, c, d, e$ and $f$. Then the characteristic polynomial of $A$ is

$$
\begin{aligned}
p_{A}(x)= & x^{4}-(a+d) x^{3}+(a d-c-b e-f) x^{2} \\
& +[(a+d) f+b d e] x+c f-a d f-e
\end{aligned}
$$

Suppose

$$
p_{A}(x)=x^{4}+(p+q) x^{2}+p q
$$

Then

$$
a+d=0
$$

and

$$
(a+d) f+b d e=0
$$

It follows that

$$
b d e=0
$$

It is a contradiction. Hence, $\mathcal{N}$ does not allow $(0,0,4)$.

Next we show that the zero-nonzero pattern $\mathcal{N}$ allows all the remaining inertias. Note that for an arbitrary zerononzero pattern $\mathcal{N},\left(n_{+}, n_{-}, n_{0}\right) \in i(\mathcal{N})$ if and only if $\left(n_{-}, n_{+}, n_{0}\right) \in i(\mathcal{N})$. So to complete the proof, it suffices to show that $\mathcal{N}$ allows inertias $(1,0,3),(2,0,2),(1,1,2)$, $(3,0,1),(2,1,1),(4,0,0),(3,1,0)$ and $(2,2,0)$.

Consider realizations of $\mathcal{N}$

$$
\begin{aligned}
& \left(\begin{array}{cccc}
-2 & 1 & 0 & \frac{1}{2} \\
-\frac{22}{3} & 3 & 1 & 0 \\
0 & 0 & 0 & 1 \\
-\frac{4}{3} & 0 & 1 & 0
\end{array}\right),\left(\begin{array}{cccc}
1 & 1 & 0 & \frac{4}{3} \\
-\frac{1}{2} & 1 & 1 & 0 \\
0 & 0 & 0 & 1 \\
-\frac{3}{4} & 0 & \frac{1}{2} & 0
\end{array}\right) \\
& \left(\begin{array}{cccc}
\frac{1}{2} & 1 & 0 & 2 \\
\frac{1}{4} & \frac{1}{2} & 1 & 0 \\
0 & 0 & 0 & 1 \\
2 & 0 & -3 & 0
\end{array}\right),\left(\begin{array}{cccc}
2 & 1 & 0 & -2 \\
4 & 1 & 1 & 0 \\
0 & 0 & 0 & 1 \\
4 & 0 & 2 & 0
\end{array}\right)
\end{aligned}
$$

$$
\begin{aligned}
& \left(\begin{array}{cccc}
\frac{1}{2} & 1 & 0 & \frac{2}{3} \\
-\frac{3}{4} & \frac{1}{2} & 1 & 0 \\
0 & 0 & 0 & 1 \\
-3 & 0 & 3 & 0
\end{array}\right),\left(\begin{array}{cccc}
2 & 1 & 0 & \frac{11}{2} \\
4 & 2 & 1 & 0 \\
0 & 0 & 0 & 1 \\
-2 & 0 & 4 & 0
\end{array}\right) \\
& \left(\begin{array}{cccc}
1 & 1 & 0 & -2 \\
1 & 1 & 1 & 0 \\
0 & 0 & 0 & 1 \\
2 & 0 & 3 & 0
\end{array}\right) \text { and }\left(\begin{array}{cccc}
1 & 1 & 0 & 1 \\
\frac{1}{2} & -2 & 1 & 0 \\
0 & 0 & 0 & 1 \\
-\frac{3}{2} & 0 & 1 & 0
\end{array}\right)
\end{aligned}
$$

with inertias $(1,0,3),(2,0,2),(1,1,2),(3,0,1),(2,1,1)$, $(4,0,0),(3,1,0)$ and $(2,2,0)$, respectively. It follows that $\mathcal{N}$ allows all inertias except $(0,0,4)$.

Corollary 1. Let $S$ be a nonempty, proper subset of the set of all $(n+1)(n+2) / 2$ inertias for $4 \times 4$ irreducible zero-nonzero patterns. If $S$ is a critical set of inertias, then $(0,0,4) \in S$.

Proof. By a way of contradiction assume that $(0,0,4)$ does not belong to $S$. Then $S$ must contain some of the rest of inertias. By Theorem $1, S \subseteq i(\mathcal{N})$ and $\mathcal{N}$ is not inertially arbitrary. It follows that $S$ is not a critical set of inertias; a contradiction.

The following result was stated as Theorem 4 in [2].
Lemma 2. Let the zero-nonzero pattern of order 4

$$
\mathcal{M}=\left(\begin{array}{llll}
0 & * & 0 & 0 \\
* & 0 & * & 0 \\
0 & 0 & * & * \\
* & 0 & 0 & *
\end{array}\right)
$$

Then $\mathcal{M}$ allows all inertias $\left(n_{1}, n_{2}, n_{3}\right)$ with nonnegative integers $n_{1}, n_{2}$ and $n_{3}$ such that $n_{1}+n_{2}+n_{3}=4$ except $(1,0,3),(0,1,3),(2,0,2)$ and $(0,2,2)$.

The following corollary indicates that the minimum cardinality of critical sets of inertias for irreducible $4 \times 4$ zero-nonzero patterns is at least 2 .

Corollary 2. There is no critical set of inertias with a single inertia for irreducible $4 \times 4$ zero-nonzero patterns. Moreover, if $S$ is a critical set of inertias for irreducible $4 \times 4$ zero-nonzero patterns, then $S$ must contain $(0,0,4)$ and one of the inertias $(1,0,3),(0,1,3),(2,0,2)$ and $(0,2,2)$.

Proof. The first part of Corollary 2 follows directly from Theorem 1 and Lemma 2. If $S$ is a critical set of inertias, then $(0,0,4) \in S$ by Corollary 1. If none of the inertias $(1,0,3),(0,1,3),(2,0,2)$ and $(0,2,2)$ is in $S$, the $S \subseteq i(\mathcal{M})$ in Lemma 2. But it is clear that $\mathcal{M}$ is not inertially arbitrary. It follows that $S$ is not a critical set of inertias; a contradiction.

Theorem 2. Let the zero-nonzero pattern of order 4

$$
\mathcal{P}=\left(\begin{array}{llll}
* & * & * & * \\
* & * & 0 & 0 \\
* & 0 & 0 & 0 \\
* & 0 & 0 & 0
\end{array}\right)
$$

# International Journal of Engineering, Mathematical and Physical Sciences <br> ISSN: 2517-9934 <br> Vol:4, No:1, 2010 

Then $\mathcal{P}$ allows all inertias $\left(n_{1}, n_{2}, n_{3}\right)$ with nonnegative integers $n_{1}, n_{2}$ and $n_{3}$ such that $n_{1}+n_{2}+n_{3}=4$ except the only inertias $(4,0,0),(0,4,0),(3,1,0),(1,3,0)$ and $(2,2,0)$.

Proof. Since $\mathcal{P}$ requires singularity, it follows that all of the inertias $(4,0,0),(0,4,0),(3,1,0),(1,3,0)$ and $(2,2,0)$ are not allowed by $\mathcal{P}$.

Consider realizations of $\mathcal{P}$

$$
\begin{aligned}
& \left(\begin{array}{cccc}
1 & 1 & 1 & 1 \\
-2 & -1 & 0 & 0 \\
1 & 0 & 0 & 0 \\
-1 & 0 & 0 & 0
\end{array}\right),\left(\begin{array}{cccc}
1 & 1 & 1 & 1 \\
1 & 1 & 0 & 0 \\
1 & 0 & 0 & 0 \\
-1 & 0 & 0 & 0
\end{array}\right), \\
& \left(\begin{array}{cccc}
1 & 1 & 1 & 1 \\
-1 & 1 & 0 & 0 \\
1 & 0 & 0 & 0 \\
-1 & 0 & 0 & 0
\end{array}\right),\left(\begin{array}{cccc}
2 & 1 & 1 & 1 \\
-3 & -2 & 0 & 0 \\
1 & 0 & 0 & 0 \\
-1 & 0 & 0 & 0
\end{array}\right), \\
& \left(\begin{array}{cccc}
1 & 1 & 1 & 1 \\
-1 & 2 & 0 & 0 \\
-2 & 0 & 0 & 0 \\
1 & 0 & 0 & 0
\end{array}\right) \text { and }\left(\begin{array}{cccc}
-1 & 1 & 1 & 1 \\
-3 & 2 & 0 & 0 \\
-1 & 0 & 0 & 0 \\
2 & 0 & 0 & 0
\end{array}\right)
\end{aligned}
$$

with inertias $(0,0,4),(1,0,3),(2,0,2),(1,1,2),(3,0,1)$ and $(2,1,1)$, respectively. It follows that the zero-nonzero pattern $\mathcal{P}$ allows all inertias except $(4,0,0),(0,4,0),(3,1,0)$, $(1,3,0)$ and $(2,2,0)$.

It was known that the set $\{(0,0,4),(1,0,3),(4,0,0)\}$ is a minimal critical set of inertias for irreducible zero-nonzero patterns of order 4 . Other minimal critical sets on inertias can be obtained by replacing $(4,0,0)$ or $(1,0,3)$ by its reversal; see, e.g., [3, Theorem 7]. As mentioned in Section 6 in [3], for $n=4$, it is unknown that whether there are other critical sets of inertias. Also mentioned is that the minimum cardinality of all critical sets of inertias for $4 \times 4$ irreducible zero-nonzero patterns is at most 3 . The next theorem answers this problem completely.

Theorem 3. The minimum cardinality of all critical sets of inertias for irreducible $4 \times 4$ zero-nonzero patterns is 3 .

Proof. By a way of contradiction suppose that the minimum cardinality of all critical sets of inertias is 2 . Let $S$ be an arbitrary critical set of inertias with cardinality 2 . Then, by Corollary $2, S$ must contain $(0,0,4)$ and only one of the inertias $(1,0,3),(0,1,3),(2,0,2)$ and $(0,2,2)$.

Case 1. $S$ contains inertias $(0,0,4)$ and $(1,0,3)$ or its reversal. Then $S$ does not contain all the inertias $(4,0,0)$, $(0,4,0),(3,1,0),(1,3,0)$ and $(2,2,0)$. By Theorem 2, we have $S \subseteq i(\mathcal{P})$ and $\mathcal{P}$ is not inertially arbitrary. It follows that $S$ is not a critical set of inertias for irreducible zero-nonzero patterns of order 4, which is a contradiction.

Case 2. The case that $S$ contains inertias $(0,0,4)$ and $(2,0,2)$ or its reversal is similar to Case 1 . We omit its proof.
